

Figure 3 of the GERP paper

```
#setwd("~/Documents/Github/pvpDiallel/")
knitr::opts_knit$set(root.dir=normalizePath('../'))
```

To reproduce the figures, we should set the current dir as your root path, i.e. `setwd("~/Documents/Github/GERP-diallel/")`. And then use `knitr` package to render the pdf file. Or simply click Knit PDF icon in RStudio. To produce different figures into separate pdf files, we should set `getpdf=TRUE` when calling the plotting functions.

First of all, determine font size and set the `getpdf` option:

```
#par(mar=c(5,4,4,2))
par(font=2, font.lab=2, font.axis=2)
fs = 1.6 # times bigger than default
fsize = 14 # absolute font size
getpdf = TRUE # get figures in separated pdf [TRUE] or not [FALSE]
```

Figure 3a and 3b

```
library(ggplot2)
```

```
## Warning: package 'ggplot2' was built under R version 3.2.3
```

```
source("lib/multiplot.R")
```

```
